

Accounting System

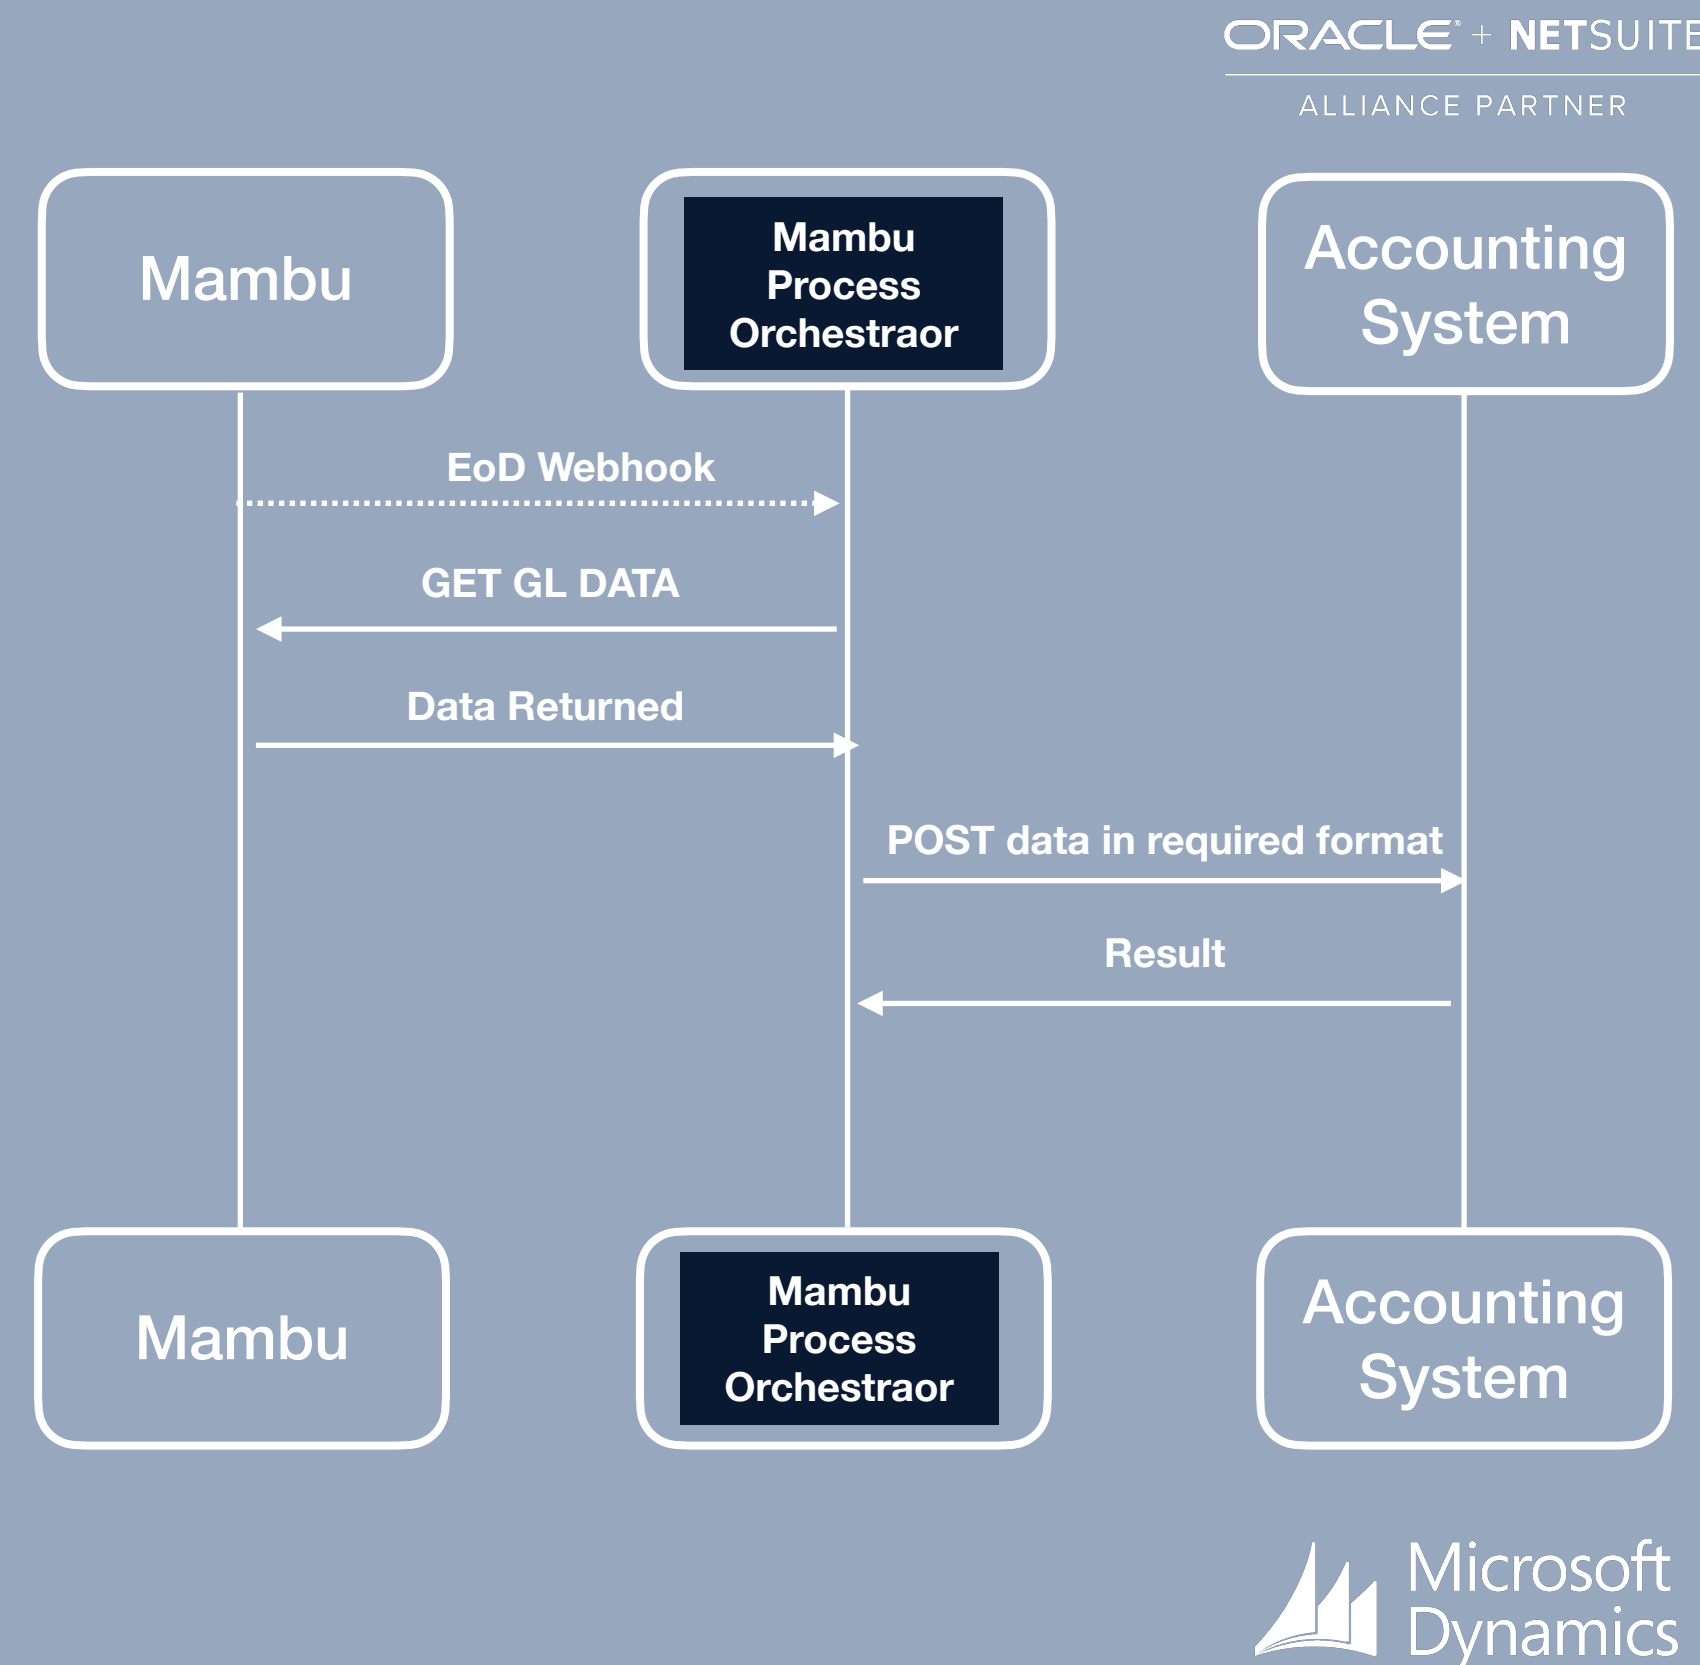

Here, we will demonstrate how Mambu operates with different accounting systems and provides the flexibility to utilise General Ledger and Sub-Ledger data to Accounting Systems

See Below Generic Flow Example

Using Mambu's capabilities such as REST APIs and Webhooks, it is possible for example to extract all Journal Entries and GL Accounts generated within Mambu daily. This can be done by relying on Mambu's EoD (End of Day) Webhook to trigger the extraction process to fully obtain all Accounting Relevant Entries generated within Mambu's Core Engine

Additionally, the MPO can be used as the Integration Layer for a low-code (high speed to market) tool to establish this connectivity. Also exists the option to utilise Mambu's connectors such as MS Dynamics for a plug and play approach for this integration

This provides total flexibility in selecting the appropriate systems that suits each ecosystem the most. As Mambu is agnostic and the data extracted in JSON can be formatted in the appropriate standard and notation required by the Accounting System via the Integration Layer
